

Peer Review Rewrite Quality Annotation

Instructions for Annotators

Section 1 — Purpose

The goal of this annotation study is to verify that rewritten peer reviews preserve the evaluative content of the original human-written reviews. You will be shown pairs of reviews — an original human review and a rewritten version — and asked to judge whether they convey the same evaluation.

Section 2 — Questions

For each pair, answer three questions:

Q1. Content Faithfulness (scale 1–5)

How faithfully does the rewritten review preserve the key evaluation points of the original?

1 = Very unfaithful: major points missing or distorted

2 = Mostly unfaithful: several key points missing or changed

3 = Partially faithful: some points preserved, some missing or changed

4 = Mostly faithful: nearly all points preserved with minor differences

5 = Perfectly faithful: all evaluation points fully preserved

Q2. Overall Equivalence (Yes / No)

Would a paper author receive essentially the same feedback from both reviews?

Yes = equivalent feedback

No = meaningfully different feedback

Section 3 — Tips

Focus on the evaluative content (what the reviewer thinks about the paper), not the wording or style. A rewrite that uses different words but makes the same points should be rated as faithful. Only mark “New Content = Yes” if the rewrite adds substantively new evaluation points.
